

1.4.5	Basic useful results to compute projections	68	2.4.1	The corresponding estimating equation	139
1.5	Robustness of Estimating Functions	69	2.4.2	Discussion of ingredients of a one-step estimator .	141
1.5.1	Robustness of estimating functions against misspecification of linear convex nuisance parameters. . .	69	2.5	Guaranteed Improvement Relative to an Initial Estimating Function	142
1.5.2	Double robustness of observed data estimating functions.	77	2.6	Construction of Confidence Intervals	144
1.5.3	Understanding double robustness for a general semiparametric model	79	2.7	Asymptotics of the One-Step Estimator	145
1.6	Doubly robust estimation in censored data models. . . .	81	2.7.1	Asymptotics assuming consistent estimation of the censoring mechanism	146
1.7	Using Cross-Validation to Select Nuisance Parameter Models	93	2.7.2	Proof of Theorem 2.4	150
1.7.1	A semiparametric model selection criterion	94	2.7.3	Asymptotics assuming that either the censoring mechanism or the full data distribution is estimated consistently	151
1.7.2	Forward/backward selection of a nuisance parameter model based on cross-validation with respect to the parameter of interest.	97	2.7.4	Proof of Theorem 2.5	152
1.7.3	Data analysis example: Estimating the causal relationship between boiled water use and diarrhea in HIV-positive men	99	2.8	The Optimal Index	153
2	General Methodology	102	2.8.1	Finding the optimal estimating function among a given class of estimating functions	159
2.1	The General Model and Overview	102	2.9	Estimation of the Optimal Index	166
2.2	Full Data Estimating Functions.	103	2.9.1	Reparametrizing the representations of the optimal full data function	167
2.2.1	Orthogonal complement of the nuisance tangent space in the multivariate generalized linear regression model (MGLM)	105	2.9.2	Estimation of the optimal full data structure estimating function	169
2.2.2	Orthogonal complement of the nuisance tangent space in the multiplicative intensity model	107	2.10	Locally Efficient Estimation with Score-Operator Representation	170
2.2.3	Linking the orthogonal complement of the nuisance tangent space to estimating functions	111	3	Monotone Censored Data	172
2.3	Mapping into Observed Data Estimating Functions . . .	114	3.1	Data Structure and Model	172
2.3.1	Initial mappings and reparametrizing the full data estimating functions	114	3.1.1	Cause-specific censoring	175
2.3.2	Initial mapping indexed by censoring and protected nuisance parameter	124	3.2	Examples	176
2.3.3	Extending a mapping for a restricted censoring model to a complete censoring model	125	3.2.1	Right-censored data on a survival time	176
2.3.4	Inverse weighting a mapping developed for a restricted censoring model	126	3.2.2	Right-censored data on quality-adjusted survival time	177
2.3.5	Beating a given RAL estimator	128	3.2.3	Right-censored data on a survival time with reporting delay	179
2.3.6	Orthogonalizing an initial mapping w.r.t. G : Double robustness	131	3.2.4	Univariately right-censored multivariate failure time data	181
2.3.7	Ignoring information on the censoring mechanism improves efficiency	135	3.3	Inverse Probability Censoring Weighted (IPCW) Estimators	183
2.4	Optimal Mapping into Observed Data Estimating Functions	137	3.3.1	Identifiability condition	183
			3.3.2	Estimation of a marginal multiplicative intensity model	184
			3.3.3	Extension to proportional rate models.	191
			3.3.4	Projecting on the tangent space of the Cox proportional hazards model of the censoring mechanism	192
			3.4	Optimal Mapping into Estimating Functions	195
